// Staff Module Header

// We check for the header file if its defined or not and then we use define to
// use it and show the rest of the code in the file
#ifndef ACADEMIA_STAFF_H // We use the "ifndef" to call whether the file is there
                         // or not there
#define ACADEMIA_STAFF_H // We use the "define" to call the file to read the code
                         // inside after the "ifndef" is successful

// We add required libraries to make sure the code runs properly and for that we
// have used "sqlite3.h"
#include <sqlite3.h>

// Update the staff frontend state file (staff_states.js) with teacher records.
void update_staff_frontend_state(int staff_user_id);

#endif
